

Hashim Meer Hashmi

Full-Stack Engineer · Backend & Distributed Systems

+91-9599117322 · hashimhashmi86@gmail.com · linkedin.com/in/hashim-hashmi · github.com/hashimhashmi02

SUMMARY

Full-stack engineer with a backend and systems focus, building scalable REST APIs, event-driven services, and AI-integrated platforms. Strong in concurrency control, caching, payments, and CI/CD. Ship production SaaS end to end with Next.js, React, TypeScript, Node.js, PostgreSQL, Redis, and Docker, and reason from first principles about queues, rate limiting, and idempotency rather than relying on managed abstractions.

EXPERIENCE

Full Stack Developer — Zuvomo

June 2026 – Present

AI HR Hiring Dashboard

- **Led the migration of the backend off Next.js API routes onto a standalone Node.js/Express service**, porting 9 endpoints and decoupling business logic from the frontend framework, cutting cold-start latency 80% and enabling independent scaling and deployment.
- **Owned resolution of three core architecture decisions** - failure path design (outbox pattern over fire-and-forget), the Temporal-vs-Kafka service boundary, and consolidating 19 planned services down to 4 deployables, cutting operational surface and deployment complexity before implementation began.
- **Drove a security-first audit** across 2 infrastructure and backend repositories, catching and fixing 10+ vulnerabilities including a critical authentication bypass in the Vapi webhook handler and a cross-repo encryption key length mismatch before they reached production.
- **Stood up the CI/CD pipeline** on GitHub Actions, Docker Compose, Caddy, and GHCR on a self-managed VPS, taking deployments from manual to a fully automated build-test-deploy in minutes.

Stack: Node.js, Express, TypeScript, Next.js, PostgreSQL, Docker, Temporal, Kafka, Vapi, GitHub Actions, Caddy, GHCR.

Freelance Full-Stack Developer

2024 – Present

Remote · Client Projects

Full-Stack Developer — DailyWages (Hyperlocal Services Marketplace) [GitHub ↗](#)

- **Launched a three-role marketplace** (Customer, Worker, Admin) connecting users with verified blue-collar workers across India, designing the full REST API surface, normalized PostgreSQL schema (Prisma), and role-based JWT authorization model.
- **Closed the booking-to-settlement loop** with a complete order lifecycle spanning real-time GPS tracking, Aadhaar identity verification, and three payment methods (UPI, wallet, cash) behind a unified transaction flow.
- **Shipped reliably to preview and production** by setting up an environment-segregated CI/CD pipeline on Vercel, and built bilingual (Hindi/English) admin analytics dashboards with Zustand and Recharts.

Stack: Next.js 16, React 19, TypeScript, Prisma + PostgreSQL, Tailwind CSS 4, Zustand, NextAuth, Zod, Recharts.

Backend Developer — Tryla (E-Commerce REST API, Fashion/Apparel) [GitHub ↗](#)

- **Reduced database load and improved p95 API latency by 15%** by adding a Redis (ioredis) caching layer over a Neon-hosted PostgreSQL store, designing cache keys and invalidation around the product catalog and cart reads.
- **Hardened payments against partial failures** by integrating dual gateways (Razorpay + PayPal) with idempotent, asynchronous webhook handlers that reconcile order state on out-of-order and duplicate events.
- **Made the codebase maintainable at scale** by structuring a modular route–controller–service architecture, enforcing Zod validation and bcrypt + JWT auth on every endpoint, and managing releases via Git.

Stack: Node.js, Express 5, Prisma + PostgreSQL (Neon), Redis, JWT, Razorpay SDK, PayPal SDK, Zod, Nodemailer.

PROJECTS

Axon — AI Workflow Automation Platform [Live ↗](#)

- **Built a visual workflow engine** handling 100+ node interactions per graph, designing the execution model so node dependencies resolve correctly and let users compose complex automations on a drag-and-drop canvas (React Flow).
- **Achieved 99.9% reliable background execution** by engineering an event-driven engine on Inngest decoupled from the request path, and reduced debugging time ~50% with Sentry trace logging and structured error tracking.
- **Secured multi-provider orchestration** by integrating 3 LLM providers (OpenAI, Anthropic, Gemini) and 4+ third-party APIs (Stripe, Slack) behind one abstraction, with AES-grade credential encryption at rest.

Stack: Next.js 16, TypeScript, React Flow, Vercel AI SDK, Inngest, Stripe, Polar, Sentry, Three.js, Framer Motion.

Doable — AI Code Generation Platform [Live ↗](#)

- **Translated natural language to live React apps in under 30s** by building a generation pipeline over Next.js 16 and a type-safe tRPC API layer that renders fully functional, live-previewed output.
- **Orchestrated a networked 3-agent system** (Writer, Summarizer, Title Generator) on Inngest and GPT-4o that performs reliable, autonomous file manipulations inside isolated E2B cloud sandboxes.
- **Scaled to 1,000+ concurrent AI task streams** by implementing credit-based rate limiting and automated sandbox teardown over a tRPC + PostgreSQL + Inngest backend, keeping resource usage bounded under load.

Stack: Next.js 16, TypeScript, tRPC, Inngest, GPT-4o, E2B, Clerk, PostgreSQL.

Bug — AI-Powered In-Browser Code Editor [Live ↗](#)

- **Delivered sub-200ms context-aware suggestions** directly in the browser by building a full-stack AI editing environment on Next.js, React, and CodeMirror 6.
- **Increased suggestion relevance** by architecting a custom CodeMirror 6 plugin that parses up to 10 surrounding lines into AI SDK streams for seamless ghost-text generation.
- **Cut redundant API calls 40%** and improved responsiveness ~150ms during rapid typing by reworking the suggestion engine with debouncing and AbortController-based request cancellation.

Stack: Next.js, React, TypeScript, CodeMirror 6, Vercel AI SDK, Convex, Vercel.

SKILLS

Languages: TypeScript, JavaScript, SQL, Java/C++ (DSA)
Backend & Systems: Node.js, Express.js, tRPC, REST API design, WebSockets, event-driven architecture, job queues, rate limiting, concurrency control, idempotency, caching, backpressure
Frontend: Next.js, React.js, Tailwind CSS, Turborepo, CodeMirror 6, React Flow, Three.js, Framer Motion
Databases: PostgreSQL, Prisma ORM, Redis, Convex — schema design, indexing, query optimization
Cloud & DevOps: AWS, Docker, Vercel, Neon, CI/CD pipelines, Git/GitHub, Sentry, Inngest, E2B, Clerk
AI/ML: Vercel AI SDK, OpenAI SDK, Anthropic SDK, Gemini, GPT-4o, prompt engineering, streaming inference
Payments: Stripe, Razorpay, PayPal, webhook integration, idempotent transaction handling
CS Foundations: Data Structures & Algorithms, OOP, Operating Systems, DBMS, system design

EDUCATION

Manipal University — Master of Computer Applications (MCA)	2024 – 2026
Jamia Hamdard University — Bachelor of Computer Applications (BCA)	2021 – 2024

RESEARCH & ACHIEVEMENTS

- **Selected for Super 30 (100xDevs)** — a merit-based cohort of 30 developers chosen from 10,000+ applicants for an intensive program covering full-stack engineering, system design, and Web3.
- Presented a research paper at ICICSSD'24 — International Conference on Intelligent Computing, Communication Systems and Sustainable Development.
